

# Migrating from QlikView NPrinting 16 to Qlik NPrinting 17

**Description** Before migrating to NP 17 from NP 16, please consider the following feature gaps in NP 17. To view the gap list, please visit the information at near the end of the page at the following link:  
<http://help.qlik.com/en-US/nprinting/September2017/Content/Introduction/Introduction.htm>

**\*NOTE: There is no direct/inplace upgrade path from NP 16 to NP 17 as they are completely separate platforms. NP 16 is 32 bit Client server program and NP 17 is 64 bit Web based console deployment.\***

NPrinting 16 and NPrinting 17 cannot be installed on the same server concurrently. We recommend setting up NP 17 in a separate environment with a separate dedicated NP server service account and evaluate NP 17 separately from NP 16. You may use your NP 16 server license for your NP 17 installation but you would need to turn off your NP 16 server to avoid licensing conflicts with existing maintenance agreements. If you wish to evaluate NP 17 separately, you may be able to request a test license from your Qlik Account Manager.

For information regarding requirements and installation process for NP 17, please visit:

<http://help.qlik.com/en-US/nprinting/September2017/Content/DeployingQVNprinting/Deploying.htm>

**\*NOTE: It is absolutely critical to meet the system requirements for NPrinting 17 before attempting to implement your migration plan\***

You must be on QlikView NPrinting 16 SR 3 or higher to leverage the project export tool found in the NP template editor.

Once you have successfully installed NP 17, you can export template projects from NP 16 and import them into NP 17.

See article **29511 How To Export NP 16 Templates and Import to NP 17** for details.
