

I am using the desktop version of Qlik Sense (12.44.3), Nov 208 Patch 2.

Step 1: connect to the webservice:

Result: HTTP protocol error 500

Step 2: connect to the WSDL. this is a zipped file.

Creating the REST-connection works, but de content of the CSV is strange: Error CSV is not valid

I think this is because the wsdl-file is a zipped file. Therefore I am thinking about two solutions:

a: download the zipped wsdl-file, unzip it and use it in the REST-connection. The problem is that I could not find a way to connect the REST-connection to a local file. ( http is required).

b: add an unzip command to the URL to guarantee that the REST-connector is getting a unzipped WSDL file. The problem is that I did not found an instruction how to do this (if it is possible).

NB: Postman gives the samen content :
