

QlikView® NPrinting 16.3.0.0 – Release notes

Fixes

The following fixes have been made in QlikView NPrinting 16.3.0.0.

QlikView NPrinting Designer

ODBC password encryption

- Passwords for ODBC connections used in recipient imports were saved in clear text in the NPrinting project file. To avoid security issues passwords are now encrypted.

SFTP

- If you clicked “Verify Connection” after creating a new SFTP site with an incorrect link you didn’t get any error messages. Reports were not distributed. Now, if you type an invalid SFTP server name, “Verify Connection” will give you an error.

FTP

- If you inserted an FTP destination as the output folder of a Task and you ran the task it wrote the following error to the log file: “Access Violation at address 007E7118 in module 'NPrinting.exe'. Read of address FFFFFFFE”. The error appeared only if you tried to save reports to the FTP root folder, everything was fine when saving in subfolders. Now resolved.
