

Qlik[®] Sense 3.0.3 – Release notes

Qlik Sense 3.0.3 is the latest release on the Qlik Sense 3.0 Service Release track. The Service Release track only includes bug fixes. Details of the fixes included in 3.0.3 are shown below. Please read the release notes thoroughly before installing or upgrading Qlik Sense.

NOTE: Qlik Sense 3.0.3 is only available as a full installation (MSI) file.

- There is no MSP file available for Qlik Sense 3.0.3, therefore an upgrade from 3.0.x requires a full install.
- If you want to rollback from 3.0.3 to a previous 3.0.x version, first uninstall 3.0.3 and then install the version you want to rollback to. Your data will not be affected.

Bug fixes

Not possible to click inside the integrated hub

Jira issue ID: QLIK-61807

Description: It wasn't possible to click on anything when using a Microsoft web browser control integration.

Qlik Sense Desktop shows unknown error after installation

Jira issue ID: QLIK-63575

Description: Under some circumstances, unknown error would be displayed upon starting Qlik Sense Desktop, and Qlik Sense Desktop wouldn't start.

Table scrollbar disappears

Jira issue ID: QLIK-63869

Description: When scroll bar was used to scroll up and down a table couple times, the scroll bar would disappear, and it became impossible to move up and down the table.

Authentication with .username does not allow to logout and does not show user name in the hub

Jira issue ID: QLIK- 63237

Description: When specifying a dot as directory instead of ServerName (form login), it wasn't possible to log out and the username wouldn't be displayed.

Cannot read property 'attributes' of undefined when using form login

Jira issue ID: QLIK-61466

Description: When logging in to the hub using .\username format rather than ServerName\username, an error message of "An Error occurred - Cannot read property 'attributes' of undefined" would be displayed.

User Directory sync + creation of users on the fly can possibly create duplicate user entry in database

Jira issue ID: QLIK-63501

Description: Performing User Directory sync at same time as opening the hub could cause the user to exist twice in the database.

Error when setting "variable name" using a name of an object ID on a UI element (extensions)

Jira issue ID: QLIK-48104

Description: When a user tried to get a variable through the capability API right after opening an app, an error would be produced.

"Convert to" option for extension object not present

Jira issue ID: QLIK-61817

Description: Not possible to convert visualization to Two Dimensional Scatter Custom Object.

Ghost rows containing NULL values added to visualizations

Jira issue ID: QLIK-65843

Description: When using section access in an app, charts would sometimes show unexpected null values.

Internal server error when doing a search in Operation Monitor

Jira issue ID: QLIK-61990

Description: When using making a search in Operation Monitor just after reloading with new data, an internal server error would be produced.

Different group names from the same domain

Jira issue ID: QLIK-65438

Description: Some Active Directory groups would in some cases be displayed with the simple domain name, but others in the same domain would be displayed with the full domain name (as if it belonged to another domain).

Unable to use views in ODBC UDCs

Jira issue ID: QLIK- 66064

Description: Not possible to use a combination of tables and views in SQL for synchronizing of users.

Can't clear selection in one field

Jira issue ID: QLIK- 58527

Description: Selecting or clearing a field would sometimes not be possible just after a reload.
