

Case study environment: QV11 SR2, SR6

Created a table like:

Load * Inline [

User, Country

User1, India

User1, USA

User1, **Switz**

User2, India

User2, **England**

User2, Singapore

User2, USA

]

That means User1 doesn't have England, and

Now I follow the following sequential approach of actions.

Test1:

1. Select User1-> Create bookmark (U1)
2. Now make a selection(England) field Country and enable 'Always One Selected Value'
3. Save application
4. Reduce the application on bookmark – U1

Result: Failed (with Error – “...because it is being used by another process.”)

Test2:

1. Select User2 -> Create bookmark (U2)
2. Now make a selection(Switz) field Country and enable 'Always One Selected Value'
3. Save application
4. Reduce the application on bookmark – U2

Result: Success

Reduced application has Country (England, India, Singapore, USA; – England selected)

Test3:

- Select 'India' (or any other which is common to both users)
- Reduce on U1, U2

Result: Success (Both)

Note: In all the cases, the bookmark was created 'Make bookmark apply on top of current selection' enabled.
