

Hello Everyone ,

I have usecase where using cCXF component to consume external https based webservice and this webservice requires an ssl certificate to communicate.

We have loaded the certificate in a keystore and configured runtime with etc/ org.apache.cxf.http.conduits-test.cfg with tls parameters as below and deployed this route having cCXF but ended up with

Caused by: javax.net.ssl.SSLHandshakeException: SSLHandshakeException invoking : Received fatal alert: handshake\_failure

Is this correct way of consuming a service with cCXF . Do we need to write any extra bean code in mediation like

here in section CONFIGURING SSL SUPPORT ?

---

org.apache.cxf.http.conduits-token.cfg

url = [https://localhost.\\*](https://localhost.*)

client.ConnectionTimeout = 20000

client.ReceiveTimeout = 20000

tlsClientParameters.disableCNCheck = true

tlsClientParameters.trustManagers.keyStore.type = JKS

tlsClientParameters.trustManagers.keyStore.password = password

tlsClientParameters.trustManagers.keyStore.file = ./etc/keystores/keystore.jks

tlsClientParameters.keyManagers.keyStore.type = JKS

tlsClientParameters.keyManagers.keyStore.password = password

tlsClientParameters.keyManagers.keyStore.file = ./etc/keystores/keystore.jks

tlsClientParameters.keyManagers.keyPassword = password

tlsClientParameters.trustManagers.keyPassword = password

---
