

In response to the latest reply post from Sabrina I am attaching a Word doc with screen shots.

Also, noted in an email reply that my PC does not have the ntlmauth.dll, not sure if this has an impact. Documentation indicates that this is required for creating an ODBC connection, which is not supported in 6.1.1, but does not show as a requirement for the SQL Server connect.

We do use Windows Authentication for our app connections. However, reading TOS documentation, it was stated that this was not supported in Rel 6.1.1, no general ODBC connections for this release. So, the SA created a new login for me using the Sql Server, which works when I connect to the DB from Sql Server Management Studio. This later attempt using Sql Server does not work for the Talend connection either

I have made several attempts to load the file but it does not seem to work. Will try responding by email.

Still looking for any input available.
